

Festulolium

Robust, high yielding and persistent

- Tall fescue type with early heading
- Very high yield capacity
- Very persistent
- Robust

Mahulena

Mahulena is a festulolium dressed like a tall fescue. A top-yielding variety combined with excellent persistency, but better feeding quality.

Genome

As part of the genome is originating from Lolium, it has improved forage quality compared to pure tall fescue.

Stems in regrowth / aftermath heading

The almost total absence of stems in regrowth, is another parameter favorable for forage/feeding quality (see chart).

Robust

Mahulena is more robust than most other varieties used on grassland.

Withstands drought and water logging

Whether it is water logged soils in the winter or strong summer drought, Mahulena withstands both!
